# Leetcode.typ

## Contents

# 0001. Two Sum

Given an array of integers `nums` and an integer `target`, return indices of the two numbers such that they add up to `target`.

You may assume that each input would have **exactly one solution**, and you may not use the same element twice.

You can return the answer in any order.

## Test Results

### Case 1 ✖

**Inputs**

**nums:** [2, 7, 11, 15]

**target:** 9

---

**Expected**

[0, 1]

---

**Your Output**

### Case 2 ✖

**Inputs**

**nums:** [3, 2, 4]

**target:** 6

---

**Expected**

[1, 2]

---

**Your Output**

## Case 3

✗

**Inputs**

**nums:** [3, 3]

**target:** 6

---

**Expected**

[0, 1]

---

**Your Output**

## Case 4

✗

**Inputs**

**nums:** [0, 0]

**target:** 1

---

**Expected**

[-1, -1]

---

**Your Output**

## Case 5

✗

**Inputs**

**nums:** [1, 4, 7, 10, 13, 16, 19, 22, 25, 28, 31, 34, 37, 40, 43, 46, 49, 52, 55, 58, 61, 64, 67, 70, 73, 76, 79, 82, 85, 88, 91, 94, 97]

**target:** 191

---

**Expected**

[31, 32]

**Your Output**

# 0002. Add Two Numbers

You are given two **non-empty** linked lists representing two non-negative integers. The digits are stored in **reverse order**, and each of their nodes contains a single digit. Add the two numbers and return the sum as a linked list.

You may assume the two numbers do not contain any leading zero, except the number 0 itself.

## Test Results

### Case 1 ✖

**Inputs**

**l1:** 2→4→3

**l2:** 5→6→4

---

**Expected**

7→0→8

---

**Your Output**

### Case 2 ✖

**Inputs**

**l1:** 0

**l2:** 0

---

**Expected**

0

---

**Your Output**

**Case 3** ✖

**Inputs**

**l1:** 9→9→9→9→9→9→9

**l2:** 9→9→9→9

**Expected**

8→9→9→9→0→0→0→1

**Your Output**

---

**Case 4** ✖

**Inputs**

**l1:** 2→4→3

**l2:** 5→6→4→9

**Expected**

7→0→8→9

**Your Output**

## 0003. Longest Substring Without Repeating Characters

Given a string s, find the length of the **longest substring** without repeating characters.

## Test Results

---

### Case 1 ✖

**Inputs**

**s:** "abcabcbb"

---

**Expected**

3

---

**Your Output**

---

### Case 2 ✖

**Inputs**

**s:** "bbbbb"

---

**Expected**

1

---

**Your Output**

---

### Case 3 ✖

**Inputs**

**s:** "pwwkew"

---

**Expected**

3

---

**Your Output**

# 0004. Median of Two Sorted Arrays

Given two sorted arrays `nums1` and `nums2` of size `m` and `n` respectively, return the **median** of the two sorted arrays.

The overall run time complexity should be $\mathcal{O}(\log(m + n))$.

## Test Results

---

**Case 1** ✖

**Inputs**

**nums1:** $[1, 3]$

**nums2:** $[2]$

---

**Expected**

2

---

**Your Output**

---

**Case 2** ✖

**Inputs**

**nums1:** $[1, 2]$

**nums2:** $[3, 4]$

---

**Expected**

2.5

---

**Your Output**

---

## Case 3 ✖

**Inputs**

**nums1:** [0, 3, 6, 9, 12, 15, 18, 21, 24, 27, 30, 33, 36, 39, 42, 45, 48, 51, 54, 57, 60, 63, 66, 69, 72, 75, 78, 81, 84, 87, 90, 93, 96, 99]

**nums2:** [0, 6, 12, 18, 24, 30, 36, 42, 48, 54, 60, 66, 72, 78, 84, 90, 96, 102, 108, 114, 120, 126, 132, 138, 144, 150, 156, 162, 168, 174, 180, 186, 192, 198]

**Expected**

66.0

**Your Output**

## 0005. Longest Palindromic Substring

Given a string s, return the **longest palindromic substring** in s.

## Test Results

<div>

### Case 1 ✗

**Inputs**

**s:** "babad"

---

**Expected**

"bab"

---

**Your Output**

</div>

<div>

### Case 2 ✗

**Inputs**

**s:** "cbbd"

---

**Expected**

"bb"

---

**Your Output**

</div>

<div>

### Case 3 ✗

**Inputs**

**s:** "abcdefgfedcbb"

---

**Expected**

</div>

"bcdefgfedcb"

**Your Output**

## Case 4

**Inputs**

**s:** "accc"

**Expected**

"ccc"

**Your Output**

## Case 5

**Inputs**

**s:** "a"

**Expected**

"a"

**Your Output**

## Case 6

**Inputs**

**s:** "aa"

**Expected**

"aa"

---

**Your Output**

---

## Case 7

✖

**Inputs**

**s:** "asasfsafdaasfsaasa"

---

**Expected**

"aasfsaa"

---

**Your Output**

---

# 0006. Zigzag Conversion

The string "PAYPALISHIRING" is written in a zigzag pattern on a given number of rows like this:

```
P   A   H   N
A P L S I I G
Y   I   R
```

And then read line by line: "PAHNAPLSIIGYIR"

Write the code that will take a string and make this conversion given a number of rows.

## Test Results

### Case 1                                                ✖

**Inputs**

**s:** "PAYPALISHIRING"

**numRows:** 3

---

**Expected**

"PAHNAPLSIIGYIR"

---

**Your Output**

### Case 2                                                ✖

**Inputs**

**s:** "PAYPALISHIRING"

**numRows:** 4

---

**Expected**

"PINALSIGYAHRPI"

---

**Your Output**

## Case 3

Inputs

**s:** "A"

**numRows:** 1

---

**Expected**

"A"

---

**Your Output**

## 0007. Reverse Integer

Given a signed 32-bit integer x, return x with its digits reversed. If reversing x causes the value to go outside the signed 32-bit integer range $[-2^{31}, 2^{31} - 1]$, then return 0.

**Assume the environment does not allow you to store 64-bit integers (signed or unsigned).**

## Test Results

**Case 1**    ✖

**Inputs**

**x:** 123

**Expected**

321

**Your Output**

**Case 2**    ✖

**Inputs**

**x:** -123

**Expected**

-321

**Your Output**

**Case 3**    ✖

**Inputs**

**x:** 120

**Expected**

21

**Your Output**

## Case 4

✗

**Inputs**

**x:** 0

**Expected**

0

**Your Output**

## Case 5

✗

**Inputs**

**x:** 23498423

**Expected**

32489432

**Your Output**

## Case 6

✗

**Inputs**

**x:** -213898800

**Expected**

-8898312

---

**Your Output**

---

**Case 7** ✖

**Inputs**

**x:** 1534236469

---

**Expected**

0

---

**Your Output**

---

**Case 8** ✖

**Inputs**

**x:** 2147483647

---

**Expected**

0

---

**Your Output**

---

**Case 9** ✖

**Inputs**

**x:** -2147483648

---

**Expected**

0

---

**Your Output**

# 0008. String to Integer (atoi)

Implement the `myAtoi(string s)` function, which converts a string to a 32-bit signed integer (similar to C/C++'s atoi function).

The algorithm for `myAtoi(string s)` is as follows:

1. Read in and ignore any leading whitespace.
2. Check if the next character (if not already at the end of the string) is '-' or '+'. Read this character in if it is either. This determines if the final result is negative or positive respectively. Assume the result is positive if neither is present.
3. Read in next the characters until the next non-digit character or the end of the input is reached. The rest of the string is ignored.
4. Convert these digits into an integer (i.e. "123" -> 123, "0032" -> 32). If no digits were read, then the integer is 0. Change the sign as necessary (from step 2).
5. If the integer is out of the 32-bit signed integer range $[-2^{31}, 2^{31} - 1]$, then clamp the integer so that it remains in the range. Specifically, integers less than $-2^{31}$ should be clamped to $-2^{31}$, and integers greater than $2^{31} - 1$ should be clamped to $2^{31} - 1$.
6. Return the integer as the final result.

**Note:**

- Only the space character ' ' is considered a whitespace character.
- **Do not ignore** any characters other than the leading whitespace or the rest of the string after the digits.

## Test Results

---

### Case 1 ✖

**Inputs**

**s:** "42"

---

**Expected**

42

---

**Your Output**

---

### Case 2 ✖

**Inputs**

---

**s:** "   -42"

---

**Expected**

-42

---

**Your Output**

---

## Case 3                                                              ✖

**Inputs**

**s:** "4193 with words"

---

**Expected**

4193

---

**Your Output**

## 0009. Palindrome Number

Given an integer x, return `true` if x is a **palindrome**, and `false` otherwise.

## Test Results

<div style="border: 1px solid red;">

**Case 1**                              ✖

**Inputs**

**x:** 121

---

**Expected**

true

---

**Your Output**

</div>

<div style="border: 1px solid red;">

**Case 2**                              ✖

**Inputs**

**x:** -121

---

**Expected**

false

---

**Your Output**

</div>

<div style="border: 1px solid red;">

**Case 3**                              ✖

**Inputs**

**x:** 10

---

**Expected**

</div>

false

---

**Your Output**

# 0010. Regular Expression Matching

Given an input string s and a pattern p, implement regular expression matching with support for `'.'` and `'*'` where:

- `'.'` Matches any single character.
- `'*'` Matches zero or more of the preceding element.

The matching should cover the **entire** input string (not partial).

## Test Results

### Case 1 ✗

**Inputs**

**s:** "aa"

**p:** "a"

**Expected**

false

**Your Output**

### Case 2 ✗

**Inputs**

**s:** "aa"

**p:** "a*"

**Expected**

true

**Your Output**

## Case 3

Inputs

**s:** "ab"

**p:** ".*"

---

Expected

true

---

Your Output

## Case 4

Inputs

**s:** "aab"

**p:** "c*a*b"

---

Your Output

## Case 5

Inputs

**s:** "mississippi"

**p:** "mis*is*p*."

---

Expected

false

---

## Case 6

**Inputs**

**s:** "ab"

**p:** ".*c"

---

**Expected**

false

---

**Your Output**

## Case 7

**Inputs**

**s:** "ab"

**p:** ".*c*"

---

**Expected**

true

---

**Your Output**

## Case 8

**Inputs**

**s:** "香蕉 x 牛奶"

**p:** "香.*牛."

**Expected**

true

**Your Output**

# 0011. Container With Most Water

You are given an integer array height of length n. There are n vertical lines drawn such that the two endpoints of the i<sup>th</sup> line are (`i, 0`) and (`i, height[i]`).

Find two lines that together with the x-axis form a container, such that the container contains the most water.

Return the maximum amount of water a container can store.

**Notice** that you may not slant the container.

## Test Results

**Case 1** ✖

**Inputs**

**height:** [1, 8, 6, 2, 5, 4, 8, 3, 7]

**Expected**

49

**Your Output**

**Case 2** ✖

**Inputs**

**height:** [1, 1]

**Expected**

1

**Your Output**

# 0012. Integer to Roman

Roman numerals are represented by seven different symbols: I, V, X, L, C, D and M.

| Symbol | Value |
|:---:|:---:|
| I | 1 |
| V | 5 |
| X | 10 |
| L | 50 |
| C | 100 |
| D | 500 |
| M | 1000 |

For example, 2 is written as II in Roman numeral, just two one's added together. 12 is written as XII, which is simply X + II. The number 27 is written as XXVII, which is XX + V + II.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not IIII. Instead, the number four is written as IV. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as IX. There are six instances where subtraction is used:

- I can be placed before V (5) and X (10) to make 4 and 9.
- X can be placed before L (50) and C (100) to make 40 and 90.
- C can be placed before D (500) and M (1000) to make 400 and 900.

Given an integer, convert it to a roman numeral.

## Test Results

**Case 1**  ✗

**Inputs**

**num:** 3

---

**Expected**

"III"

---

**Your Output**

## Case 2

Inputs

## 0015. 3Sum

Given an integer array nums, return all the triplets `[nums[i], nums[j], nums[k]]` such that `i != j`, `i != k`, and `j != k`, and `nums[i] + nums[j] + nums[k] == 0`.

Notice that the solution set must not contain duplicate triplets.

## Test Results

**Your Output**

# 0017. Letter Combinations of a Phone Number

Given a string containing digits from 2-9 inclusive, return all possible letter combinations that the number could represent. Return the answer in **any order**.

A mapping of digits to letters (just like on the telephone buttons) is given below. Note that 1 does not map to any letters.

## Test Results

**Case 1**   ✗

**Inputs**

**digits:** "23"

---

**Expected**

["ad", "bd", "cd", "ae", "be", "ce", "af", "bf", "cf"]

---

**Your Output**

## Case 2

✖

**Inputs**

**digits:** ""

---

**Expected**

[]

---

**Your Output**

## Case 3

✖

**Inputs**

**digits:** "2"

---

**Expected**

["a", "b", "c"]

---

**Your Output**

# 0018. 4Sum

Given an array nums of n integers, return an array of all the unique quadruplets [nums[a], nums[b], nums[c], nums[d]] such that:

- 0 <= a, b, c, d < n
- a, b, c, and d are **distinct**.
- nums[a] + nums[b] + nums[c] + nums[d] == target

You may return the answer in **any order**.

## Test Results

### Case 1                                                                    ✖

**Inputs**

**nums:** [1, 0, -1, 0, -2, 2]

**target:** 0

---

**Expected**

[ [-2, -1, 1, 2] , [-2, 0, 0, 2] , [-1, 0, 0, 1] ]

---

**Your Output**

### Case 2                                                                    ✖

**Inputs**

**nums:** [2, 2, 2, 2]

**target:** 8

---

**Expected**

[ [2, 2, 2, 2] ]

---

**Your Output**

## Case 3 ✗

**Inputs**

**nums:** [-5, -4, -3, -2, -1, 0, 1, 2, 3, 4]

**target:** 3

---

**Expected**

[ [-5, 1, 3, 4] , [-4, 0, 3, 4] , [-4, 1, 2, 4] , [-3, -1, 3, 4] , [-3, 0, 2, 4] , [-3, 1, 2, 3] , [-2, -1, 2, 4] , [-2, 0, 1, 4] , [-2, 0, 2, 3] , [-1, 0, 1, 3] ]

**Your Output**

## 0019. Remove Nth Node From End of List

Given the head of a linked list, remove the nth node from the end of the list and return its head.

### Test Results

---

**Case 1** ✖

**Inputs**

**head:** 1→2→3→4→5

**n:** 2

---

**Expected**

1→2→3→5

---

**Your Output**

---

**Case 2** ✖

**Inputs**

**head:** 1

**n:** 1

---

**Expected**

∅

---

**Your Output**

---

**Case 3** ✖

**Inputs**

**head:** 1→2

---

**n:** 1

---

**Expected**

1

---

**Your Output**

# 0020. N-Queens

The **n-queens** puzzle is the problem of placing $n$ queens on an $n \times n$ chessboard such that no two queens attack each other.

Given an integer $n$, return *all distinct solutions* to the **n-queens puzzle**. You may return the answer in **any order**.

Each solution contains a distinct board configuration of the n-queens' placement, where `'Q'` and `'.'` both indicate a queen and an empty space, respectively.

## Test Results

### Case 1 ✖

**Inputs**

**n:** 1

---

**Expected**

Q

---

**Your Output**

### Case 2 ✖

**Inputs**

**n:** 2

---

**Expected**

[]

---

**Your Output**

## Case 3

**Inputs**

**n:** 4

---

**Expected**
